Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

.; Comment: This protein mediates the motor neuron-induced aggregation of acetylcholine rations. This protein mediates the motor constraint labeled below as form 3. Comment: 90% of rat embryonic transcripts encode the variant labeled below as form 3. Superfamily: aggrin, EGF homology; Kazal proteinase inhibitor homology; laminin G repeative splicing; duplication; glycoprocein; neuromuscular junction 7:1-1592. Product: agrin, form 1 #status predicted <AG4>

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A/Bxperimental source: embryo
A/Note: sequence extracted from NCBI backbone (NCBIP:126158)
C/Comment: This protein has many EGF repeats and lin-12/Notch repeats.
C/Comment: This protein is one of the neurogenic proteins controlling the decision betwee C/Superfamily: notch protein; ankyrin repeat homology; EGF homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            C;Species: Rattus norvegicus (Norway rat)

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

[ABDLINE-22660472; PubMed=12754519; Annay H., Li X.-J., Martin D.B., Aebersold R.; Abbang H., Li X.-J., Martin D.B., Aebersold R.; Andentification and quantification of N-linked glycoproteins using hydrazide chemistry, stable isotope labeling and mass spectrometry."; The "Identification and quantification is an integral component of basement membranes. It is responsible for the fixed negative electrostatic charge and is involved in the charge-selective ultrafiltration properties. It serves as an attachment substrate for cells.

C. -- SUBONAT: Purified perlecan has a strong tendency to aggregate in dimers or stellate structures. It interacts with other basement membrane components such as laminin, prolargin and collagen type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1- SUBCELLULAR LOCATION: Extracellular.
1- TISSUE SPECIFICITY: Found in the basement membranes.
1- TISSUE SPECIFICITY: Found in the basement membranes.
1- PTM: CONTAINS THERE HEPRRAN SULFATE CHAINS AS WELL AS N-LINKED
2- AND O-LINKED OLIGOSACHARIDES.
2- I- DISEASE: Defects in HSPG2 are the cause of Schwartz-Jampel
2- Grandrome (SJG1) [MIM:255800]; a rare autosomal recessive disorder characterized by permanent myotonia (prolonged failure of muscle characterized by permanent myotonia (prolonged failure of muscle relaxation) and skeletal dysplasia, resulting in reduced stature, Kyphoscollosis, bowing of the diaphyses and irregular epiphyses.
2- SIMILARITY: Contains 4 IDA-receptor class A domains.
2- SIMILARITY: Contains 2 laminin EGF-like domains.
2- SIMILARITY: Contains 3 laminin Like C2-type domains.
2- SIMILARITY: Contains 4 EGF-like domains.
2- SIMILARITY: Contains 1 SEA domain.
                                                                                                                                                                                     [6]

"The complete sequence of perlecan, a basement membrane heparan sulfate proteoglycan, reveals extensive similarity with laminin A chain, low density lipoprotein-receptor, and the neural cell adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 -1- SUBCELLULAR LOCATION: Extracellular.
-1- TISSUE SPECIFICITY: Found in the basement membranes.
-1- TISSUE SPECIFICITY: Found in the basement membranes.
-1- FTM: CONTAINS THREE HEPARAN SULFATE CHAINS AS WELL AS N-LINKED AND O-LINKED OLIGOSACCHARIDES.
-1- SIMILARITY: Contains 1 laminin EGF-like domains.
-1- SIMILARITY: Contains 3 laminin IV domains.
-1- SIMILARITY: Contains 15 immunoglobulin-like C2-type domains.
-1- SIMILARITY: Contains 1 Baminin G-like domains.
-1- SIMILARITY: Contains 1 SGF-like domains.
-1- SIMILARITY: Contains 1 SGF-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMBL, M7174; AAA39911.1; ---

BROSIT
FUNCTION: Component of the basal lamina that causes the aggregation of acetylcholine receptors and acetylcholine-esterase on the surface of muscle fibers of the neuromuscular junction. SUBUNIT: Binds to laminin. Subscribular LOCATION: Synaptic basal lamina at the neuromuscular
                                                                                                                                                                                                                                                                                                                                                                                           ISOIG=P25304-5; Sequence=VSP_001368;

-1 TISSID SPECIFICITY: Embryonic nervous system and muscle.
-1 DEVELOPMENTAL STAGE: More abundant early in development.
-1 PTM: Contains Heparan sulfate chains as well as N-linked and O-linked oligosaccharidas (By similarity).
-1 SIMILARITY: Contains 9 Kazal-like domains.
-1 SIMILARITY: Contains 1 Saminin SGF-like domains.
-1 SIMILARITY: Contains 1 SEA domains.
-1 SIMILARITY: Contains 1 SEA domain.
-1 SIMILARITY: Contains 3 laminin G-like domains.
-1 SIMILARITY: Contains 3 laminin G-like domains.
-1 CAUTION: It is uncertain whether Met-1, Met-18 or Met-24 is the initiator.
                                                                                                                                                 Event=Alternative splicing; Named isoforms=5;
Comment=Additional isoforms seem to exist. Isoforms differ
their acetylcholine receptor clustering activity;
                                                                                                                                                                                                                                                          Name=2;

Note=No experimental confirmation available;
C -1-'TISSUE SPECIFICITY: Highly expressed in the brain, lung and thymus. Expressed at lower levels in the spleen, bone-marrow, spinal cord, evee, mammary gland, liver, intestine, skeletal muscle, kidney and heart.
C -1- DEVELOPMENTAL STAGE: First detected in the mesoderm at 7.5 dpc By a S.5 dpc highly expressed in presonitic mesoderm at 7.5 dpc By enothelial cells, while much lower levels are seen in the neuroepithelium. Between 9.5-10.5 dpc expressed at high levels in the neuroepithelium, and eveloping whisker follicles.
C -1- PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment NIEO; Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MEDLINE-21123790; PubMed=1125752;

Somite formation and neurogenesis. Involved in mesoder maturation of both CD4+ and CD8+ cells in the thymus. SUBURITY: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(TM) and a N-terminal fragment N(TM) and a N-bonds. Interacts with DTX1 and DTX2. SUBCELLIDIAR IOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus. ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              POST-TRANSLATIONAL PROCESSING.

"Expression patterns of Notch-DSL signaling system during brain throttonal roles for the Notch-DSL signaling system during brain development.";

"Comp. Neurol. 436:167-181(2001).

"I Comp. Neurol. 436:167-181(2001).

"I FUNCTION: Functions as a receptor for membrane-bound ligands Jagged. Jam Deltal to regulate cell-fate determination. Upon ligand activates and Deltal to regulate cell-fate determination. Upon ligand activates genes of the enhancer of split locus. RPP-Y kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). Acts instructively to control the cell fate determination of CNS multipotent progenitor cells, resulting in astroglial induction and neuron/oligodendrocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -!- TISSUE STATE INCITY: Expressed in the brain, kidney and spleen.

Expressed in poetnatal central nervous system (CNS) germinal zones and, in early postnatal life, within numerous cells throughout the CNS. Found in both subventricular and ventricular germinal zones.
-!- DEVELOPMENTAL STAGE: In the embryo, highest levels occur between adupts 12 and 14 and decrease rapidly to much lower levels in the adult.
                                                                                                                                                                                                    Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

which is proceolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EO). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).

C-IPM: Phosphorylated (By similarity).

C-IPM: PLASTIY: Contains 3 in/Notch repeats.
                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. -I-CATALYIT ACTIVITY: AFF + sulfate = diphosphate + adenylylsulfate.
-I-PATHWAY: First step in the sulfate activation pathway. This
reaction occurs early in the reductive branch of the cysteine

-!- CATALYTIC ACTIVITY: Release of an N-terminal amino acid, Xaa-|-
XDb-, in which Xaa is preferably Leu, but may be other amino acids
including Pro although not Arg or Lys, and XDb may be Pro.
-!- COFACTOR: Binds 2 manganese ions per subunit (By similarity).
-!- SUBCELIULAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: Belongs to peptidase family MI7.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -1- TISSUE SPECIFICITY: Brain.
-1- SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
-1- SIMILARITY: Contains 2 SEP-like domains.
-1- SIMILARITY: Contains 2 link domains.
-1- SIMILARITY: Contains 1 C-type lectin family domain.
-1- SIMILARITY: Contains 1 C-type lectin family domain.
-1- SIMILARITY: Contains 1 Sushi (SCR) domain.
-1- SIMILARITY: Belongs to the aggrecan/versican proteoglycan family.

EGF homologous sequences encoded in the genome of Drosophila

T melanogascer, and their relation to neurogenic genes.";

EMBO J. 6:761-76(1987).

C PUNCTION: May play a role in the development of epithelia,

Dossibly for the establishment and/or maintenance of cell

C --- FUNCTION: May a ct as a signal.

--- SUBCILULAR LOCATION: Type I membrane protein.

--- SUBCILULAR LOCATION: Type I membrane protein.

--- STMILARITY: Contains 29 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CRUMBS PROTEIN.

```
-i- PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a Cterminal fragment N(TW) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  VARIANT CADASIL 114-GLY--PRO-120 DEL.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                          US-10-006-011A-3

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
